Dear PsiQuantum Hiring Team,

I'm applying for the **Director, Compute Platforms & AI** role. It reads like a description of the work I do today: owning compute-platform strategy across cloud and on-prem, running the development infrastructure and observability that engineering depends on, and leading the enterprise evaluation and adoption of generative AI — all under the operational, security, and cost discipline a role reporting to the CISO demands.

For 15+ years I've designed, built, and operated complex infrastructure at scale. At AWS I owned the build, CI/CD, release ecosystem, and test tooling for Redshift — one of AWS's largest-scale distributed data services — including the servers and fully automated build/deploy across every AWS region, plus a Bors-style automated merge queue that eliminated broken-mainline incidents org-wide. That is the "development infrastructure (CI/CD, artifact management)" and "complex, high-scale systems" the role calls for, learned on a system where reliability was non-negotiable.

As VP of Engineering / Head of Automation at CruxOCM, I lead a distributed org across platform, infrastructure, DevOps, security, and quality, and I've done exactly the two things this role pairs:

- **Compute platforms & operational excellence** — Kubernetes across GCP and Azure with GitOps governance and Terraform; deep observability on Grafana LGTM (metrics, logs, traces) with PagerDuty alerting; SLOs and blameless incident resolution at 99.99% uptime; and capacity/cost work that saved >$200K on ~$2M of cloud spend. ISO 27001 and SOC 2 audits owned.
- **Generative-AI adoption, governed** — I led the org-wide rollout of Gemini Enterprise and standardized Cursor and Claude Code with automated PR review across engineering and business workflows, deciding build-vs-buy and managing the operational, security, and cost trade-offs of each tool rather than letting adoption sprawl.

I'm hands-on where it matters and a mentor where it counts — I hire, grow, and raise the technical bar for engineers and leaders, and I set the infrastructure standards teams actually follow. The chance to do this at the frontier of computing, supporting the platforms behind PsiQuantum's mission, is exactly the kind of demanding environment I want to be in.

I'd welcome the opportunity to discuss how I can help. Thank you for your consideration.

Sincerely,

Ishan Shah

P.S. — Purple. A small nod that I read the details all the way through; it's the same attention to the fine print that I bring to infrastructure standards, change control, and security reviews.
